DIAZABICYCLONONENE AND  
TETRAHYDROPYRIDINE DERIVATIVES AS RENIN INHIBITORS

5

The invention relates to novel compounds of the general formula I. The invention also concerns related aspects including processes for the preparation of the compounds, pharmaceutical compositions containing one or more compounds of formula I and especially their use as renin inhibitors in cardiovascular events and  
10 renal insufficiency. Furthermore, these compounds can be regarded as inhibitors of other aspartyl proteases and might therefore be useful as inhibitors of plasmepsins to treat malaria and as inhibitors of *Candida albicans* secreted aspartyl proteases to treat fungal infections.

15 In the renin-angiotensin system (RAS) the biologically active angiotensin II (Ang II) is generated by a two-step mechanism. The highly specific enzyme renin cleaves angiotensinogen to angiotensin I (Ang I), which is then further processed to Ang II by the less specific angiotensin-converting enzyme (ACE). Ang II is known to work on at least two receptor subtypes called AT<sub>1</sub> and AT<sub>2</sub>. Whereas  
20 AT<sub>1</sub> seems to transmit most of the known functions of Ang II, the role of AT<sub>2</sub> is still unknown.

Modulation of the RAS represents a major advance in the treatment of cardiovascular diseases. ACE inhibitors and AT<sub>1</sub> blockers have been accepted to  
25 treat hypertension (Waeber B. *et al.*, "The renin-angiotensin system: role in experimental and human hypertension", in Berkenhager W. H., Reid J. L. (eds): *Hypertension*, Amsterdam, Elsevier Science Publishing Co, 1996, 489-519; Weber M. A., *Am. J. Hypertens.*, 1992, 5, 247S). In addition, ACE inhibitors are used for renal protection (Rosenberg M. E. *et al.*, *Kidney International*, 1994, 45,  
30 403; Breyer J. A. *et al.*, *Kidney International*, 1994, 45, S156), in the prevention of congestive heart failure (Vaughan D. E. *et al.*, *Cardiovasc. Res.*, 1994, 28, 159;

Fouad-Tarazi F. *et al.*, *Am. J. Med.*, **1988**, *84 (Suppl. 3A)*, 83) and myocardial infarction (Pfeffer M. A. *et al.*, *N. Engl. J. Med.*, **1992**, *327*, 669).

The rationale to develop renin inhibitors is the specificity of renin (Kleinert H. D.,  
5 *Cardiovasc. Drugs*, **1995**, *9*, 645). The only substrate known for renin is  
angiotensinogen, which can only be processed (under physiological conditions) by  
renin. In contrast, ACE can also cleave bradykinin besides Ang I and can be by-  
passed by chymase, a serine protease (Husain A., *J. Hypertens.*, **1993**, *11*, 1155).  
In patients inhibition of ACE thus leads to bradykinin accumulation causing  
10 cough (5-20%) and potentially life-threatening angioneurotic edema (0.1-0.2%)  
(Israili Z. H. *et al.*, *Annals of Internal Medicine*, **1992**, *117*, 234). Chymase is not  
inhibited by ACE inhibitors. Therefore, the formation of Ang II is still possible in  
patients treated with ACE inhibitors. Blockade of the AT<sub>1</sub> receptor (e.g. by  
losartan) on the other hand overexposes other AT-receptor subtypes to Ang II,  
15 whose concentration is dramatically increased by the blockade of AT<sub>1</sub> receptors.  
This may raise serious questions regarding the safety and efficacy profile of AT<sub>1</sub>  
receptor antagonists. In summary, renin inhibitors are not only expected to be  
different from ACE inhibitors and AT<sub>1</sub> blockers with regard to safety, but more  
importantly also with regard to their efficacy to block the RAS.

20

Only limited clinical experience (Azizi M. *et al.*, *J. Hypertens.*, **1994**, *12*, 419;  
Neutel J. M. *et al.*, *Am. Heart*, **1991**, *122*, 1094) has been created with renin  
inhibitors because of their insufficient oral activity due to their peptidomimetic  
character (Kleinert H. D., *Cardiovasc. Drugs*, **1995**, *9*, 645). The clinical  
25 development of several compounds has been stopped because of this problem  
together with the high cost of goods. Only one compound containing four chiral  
centers has entered clinical trials (Rahuel J. *et al.*, *Chem. Biol.*, **2000**, *7*, 493;  
Mealy N. E., *Drugs of the Future*, **2001**, *26*, 1139). Thus, metabolically stable,  
orally bioavailable and sufficiently soluble renin inhibitors that can be prepared on  
30 a large scale are missing and sought. Recently, the first non-peptide renin  
inhibitors were described which show high *in vitro* activity (Oefner C. *et al.*,  
*Chem. Biol.*, **1999**, *6*, 127; Patent Application WO97/09311; Märki H. P. *et al.*, *II*

*Farmaco*, 2001, 56, 21). However, the development status of these compounds is not known.

The present invention relates to the identification of renin inhibitors of a non-peptidic nature and of low molecular weight. Orally active renin inhibitors of long duration of action which are active in indications beyond blood pressure regulation where the tissular renin-chymase system may be activated leading to pathophysiologically altered local functions such as renal, cardiac and vascular remodeling, atherosclerosis, and possibly restenosis are described.

10

The present invention describes non-peptidic renin inhibitors.

In particular, the present invention relates to novel compounds of the general formula I,

The compounds of general formula **I** and their pharmaceutically acceptable salts  
15 may be used as therapeutics e.g. in form of pharmaceutical compositions. These pharmaceutical compositions containing at least one compound of general formula **I** and usual carrier materials and adjuvants may especially be used in the treatment or prophylaxis of disorders which are associated with a dysregulation of the renin angiotensin system (RAS), comprising cardiovascular and renal diseases.  
20 Examples of such diseases are hypertension, congestive heart failure, pulmonary heart failure, coronary diseases, cardiac insufficiency, renal insufficiency, renal or myocardial ischemia, atherosclerosis, and renal failure. They can also be used to prevent restenosis after balloon or stent angioplasty, to treat erectile dysfunction, glomerulonephritis, renal colic, and glaucoma. Furthermore, they can be used in  
25 the therapy and the prophylaxis of diabetic complications, complications after vascular or cardiac surgery, complications of treatment with immunosuppressive agents after organ transplantation, complications of cyclosporin treatment, as well as other diseases presently known to be related to the RAS.

30 In another embodiment, the invention relates to a method for the treatment and/or prophylaxis of diseases which are related to the RAS comprising hypertension, congestive heart failure, pulmonary hypertension, cardiac insufficiency, renal

insufficiency, renal or myocardial ischemia, atherosclerosis, renal failure, erectile dysfunction, glomerulonephritis, renal colic, glaucoma, diabetic complications, complications after vascular or cardiac surgery, restenosis, complications of treatment with immunosuppressive agents after organ transplantation, and other  
5 diseases which are related to the RAS, which method comprises administering a compound according to general formula I to a human being or animal.

The invention further relates to the use of compounds of general formula I as defined above for the treatment and/or prophylaxis of disorders which are  
10 associated with the Renin Angiotensin System (RAS) comprising hypertension, congestive heart failure, pulmonary hypertension, cardiac insufficiency, renal insufficiency, renal or myocardial ischemia, atherosclerosis, renal failure, erectile dysfunction, glomerulonephritis, renal colic, glaucoma, diabetic complications, complications after vascular or cardiac surgery, restenosis, complications of  
15 treatment with immunosuppressive agents after organ transplantation, and other diseases known to be related to the RAS.

In addition, the invention relates to the use of compounds as defined above for the preparation of medicaments for the treatment and/or prophylaxis of diseases  
20 which are associated with the RAS such as hypertension, coronary diseases, cardiac insufficiency, renal insufficiency, renal and myocardial ischemia, and renal failure.

The compounds of formula I may also be used in combination with one or more  
25 other pharmacologically active compounds comprising ACE inhibitors, angiotensin II receptor antagonists, endothelin receptor antagonists, vasodilators, calcium antagonists, potassium activators, diuretics, sympatholitics, beta-adrenergic antagonists, alpha-adrenergic antagonists, and neutral endopeptidase inhibitors, for the treatment of the above-mentioned diseases or disorders.

30

All forms of prodrugs leading to an active component comprised by general formula I above are included in the present invention.

The compounds of general formula I can be manufactured by the methods outlined below, by the methods described in the examples or by analogous methods.

Preparation of the precursors:

Precursors are compounds which were prepared as key intermediates and/or building blocks and which were suitable for further transformations in parallel chemistry.

Bicyclononanone **A** was prepared from (4-benzyl-6-ethoxycarbonylmethyl-1-methylpiperazin-2-yl)acetic acid ethyl ester (Patent Application WO92/05174) as described in Scheme 1. Derivative **A** might also be present as enol form. In order to allow a coupling at the 7-position of bicyclononanone **A** with aryl bromides, the vinyl triflate derivative **B** was prepared.

Scheme 1

15

Compound **B** can be then transformed into compounds of type **C** by a *Negishi* coupling (Scheme 2), whereas  $R^b$  represents a side chain precursor suitable to construct the V-U-chain through one or several elementary chemical transformations. The  $R^b$ -substituent can be modified during the synthesis. After protecting group manipulations leading to compounds of type **D** the  $L^1$ -substituent can be put in place (compounds of type **E**), whereas  $L^1$  represents a substituent **L** as defined in general formula I, or a precursor of such a substituent. The ester functional group can be saponified to compounds of type **F**. After an amide coupling for instance precursors of type **G** can be obtained.

25

Scheme 2

- 5 Other type of compounds described in the general formula I can be prepared using the chemistry described in patent application WO03/093267.

Otherwise heterocyclic systems may be prepared according to the literature existing for similar compounds. For instance pyridine derivative H could be prepared from 2,6-dibromopyridine, wherein R<sup>a</sup> is a substituent that may be easily transformed into a chain U-V as described in Formula I (Scheme 3; Bitman, R., et al.; *J. Org. Chem.*, **2000**, 65, 7634). Pyridine J could be prepared by addition of a Grignard reagent on 4-bromopyridine, followed by oxidation (see Comins, D.; et al.; *J. Org. Chem.*, **1985**, 50, 4410). From known 3,5-dibromopyridine a compound of type K could be prepared. Finally pyridines of type L could be prepared from commercially available 2-(pyridin-4-yl)-alcohol, according to the

10

15

literature described for similar compounds (Taylor, S. L.; et. al.; *J. Org. Chem.*, 1983, 48, 4156).

Scheme 3

5

Pyridine derivatives of type **M** could be prepared according to the literature (Scheme 4, Newkome, G. R.; et al.; *J. Am. Chem. Soc.*, 1975, 97, 3232). Known  
 10 (4-bromopyridin-2-yloxy)acetic acid could lead to compound **N** by reduction. Compounds of type **O** could be prepared from 3,5-dibromopyridine, according to

Harrowven, D. C.; et al.; *Tetrahedron*, **2001**, 57, 4447. Known (2-bromopyridin-4-yl)acetic acid (Den Hertog, H. J.; et al.; *Chem. Pharm. Bull.*, **1975**, 23, 3008) could lead to compound **P** by reduction as well.

5

Scheme 4

A reduction of the known (4-bromopyrimidin-2-yl)acetic acid methyl ester (Brown, D. J.; et al.; *Australian J. Chem.*, **1978**, 31, 649) could lead to the desired pyrimidine intermediate **Q** (Scheme 5). As well, a palladium-catalyzed coupling could transform 2,4-dibromopyrimidine into a compound of type **R** (see

10

Gronowitz, S.; et al.; *Chem. Scripta*, **1986**, 26, 305). Also, compounds of type S could be prepared from 6-alkyl-1H-pyrimidin-4-one.

Scheme 5

5

A palladium-catalyzed coupling of 2,4-dibromopyrimidine with bicyclononene **B** could lead to an intermediate of type **T**, which could be transformed into an intermediate of type **U** (Scheme 6). 6-Chloropyrazin-2-ylamine could be transformed in several steps into a pyrazine of type **V** (see Ghosh, A. K.; et al.; *J. Med. Chem.*, **1993**, 36, 2300 or Jovanovic, M. V., *Heterocycles*, **1983**, 20, 2011, or Hartman, G. D.; et al.; *J. Heterocyclic Chem.*, **1983**, 20, 1089). Pyrimidines of type **W** could be prepared according to standard procedures. Finally a compounds of type **X** can be prepared from 4,6-dichloropyrimidine.

2)  $\text{R}^a\text{CH}_2\text{OH}$ 

3) Deprotection of the amine

4) Diazotation and bromination

1)  $\text{R}^a\text{CH}_2\text{OH}$ 2)  $\text{NH}_3$ 

3) Diazotation, bromination

Pyridazinyl derivatives may be prepared as described in Scheme 7. For instance known 2-pyridazin-3-ylethanol **Y** (Rodriguez, L.; *et al.*; *Synlett*, **1990**, 227) could be transformed into a pyridazinyl derivative **Z** following known chemistry (Sauer, J.; *et al.*; *Tetrahedron*, **1998**, 54, 4297). Known 6-bromo-pyridazine-4-carboxylic acid ethyl ester **AA** (Dulayyi, A.; *et al.*; *Tetrahedron*, **1998**, 54, 12897; Barlin, G. B.; *et al.*; *Australian J. Chem.*, **1977**, 30, 2319) could be alkylated, then reduced to a derivative **AB** bearing the desired R<sup>a</sup>-substituent. Also, known compound **AC** (Brundish, D. E.; *et al.*; *J. Labelled Compounds and Radiopharmaceuticals*, **1988**, 25, 1371) could be transformed to derivative **AD** that could be reduced to pyridazinyl derivative **AE**. Hydrolysis could lead to derivative **AF**, finally *O*-alkylation to the desired intermediate **AG**.

Scheme 7

Preparation of final compounds

Precursors **G** were transformed into the corresponding aryl ethers (Scheme 8), using the *Mitsunobu* reaction conditions. After deprotection, the final compounds are obtained.

- 10 The compounds of formula **I** and their pharmaceutically acceptable acid addition salts can be used as medicaments, e. g. in the form of pharmaceutical preparations for enteral, parenteral, or topical administration. They can be administered, for example, perorally, e. g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, rectally, e. g. in the form of suppositories, parenterally, e. g. in the form of injection solutions or infusion solutions, or topically, e. g. in the form of ointments, creams or oils.
- 15

The production of pharmaceutical preparations can be effected in a manner which will be familiar to any person skilled in the art by bringing the described compounds of formula **I** and their pharmaceutically acceptable acid addition salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

20

25

Suitable carrier materials are not only inorganic carrier materials, but also organic carrier materials. Thus, for example, lactose, corn starch or derivatives thereof, talc, stearic acid or its salts can be used as carrier materials for tablets, coated

tablets, dragées and hard gelatine capsules. Suitable carrier materials for soft gelatine capsules are, for example, vegetable oils, waxes, fats and semi-solid and liquid polyols (depending on the nature of the active ingredient no carriers are, however, required in the case of soft gelatine capsules). Suitable carrier materials  
5 for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar and the like. Suitable carrier materials for injections are, for example, water, alcohols, polyols, glycerols and vegetable oils. Suitable carrier materials for suppositories are, for example, natural or hardened oils, waxes, fats and semi-liquid or liquid polyols. Suitable carrier materials for topical  
10 preparations are glycerides, semi-synthetic and synthetic glycerides, hydrogenated oils, liquid waxes, liquid paraffins, liquid fatty alcohols, sterols, polyethylene glycols and cellulose derivatives.

Usual stabilizers, preservatives, wetting and emulsifying agents, consistency-  
15 improving agents, flavour-improving agents, salts for varying the osmotic pressure, buffer substances, solubilizers, colorants and masking agents and antioxidants come into consideration as pharmaceutical adjuvants.

The dosage of compounds of formula I can vary within wide limits depending on  
20 the disease to be controlled, the age and the individual condition of the patient and the mode of administration, and will, of course, be fitted to the individual requirements in each particular case. For adult patients a daily dosage of about 1 mg to about 1000 mg, especially about 50 mg to about 500 mg, comes into consideration.

25 The pharmaceutical preparations conveniently contain about 1 - 500 mg, preferably 5 - 200 mg of a compound of formula I.

The following examples serve to illustrate the present invention in more detail.  
30 They are, however, not intended to limit its scope in any manner.

After 1 day, the mixture was filtered through *Celite* and washed with MeOH. The solvents were removed under reduced pressure and the foamy residue (92.7 g) was dried under high vacuum. A sol. of *t*BuOK (117.2 g, 1.04 mol) in toluene (3.07 L) was heated to reflux. A sol. of the crude piperazine formerly obtained, dissolved in THF (300 mL), was added dropwise over 50 min. The black mixture was stirred for 10 further min. and allowed to cool to rt. The mixture was cooled to 0 °C and AcOH (36.6 mL, 0.635 mol) was added. The solvents were removed under reduced pressure. This crude material was suspended in CH<sub>2</sub>Cl<sub>2</sub> (400 mL) and cooled to 0 °C. DIPEA (19.1 mL, 112 mmol) was added. A sol. of Boc<sub>2</sub>O (24.3 g, 113 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (200 mL) was added dropwise. The mixture was stirred for 1 h at 0 °C, then 1 h at rt. 10 The following assay was carried out in order to determine the activity of the compounds of general formula I and their salts.

**Inhibition of human recombinant renin by the compounds of the invention**

15 The enzymatic in vitro assay was performed in 384-well polypropylene plates (Nunc). The assay buffer consisted of 10 mM PBS (Gibco BRL) including 1 mM EDTA and 0.1% BSA. The incubates were composed of 50  $\mu$ L per well of an enzyme mix and 2.5  $\mu$ L of renin inhibitors in DMSO. The enzyme mix was premixed at 4°C and consists of the following components:

- 20 • human recombinant renin (0.16 ng/mL) • synthetic human angiotensin(1-14) (0.5  $\mu$ M)  
• hydroxyquinoline sulfate (1 mM)

The mixtures were then incubated at 37°C for 3 h.

To determine the enzymatic activity and its inhibition, the accumulated Ang I was  
25 detected by an enzyme immunoassay (EIA) in 384-well plates (Nunc). 5  $\mu$ L of the incubates or standards were transferred to immuno plates which were previously coated with a covalent complex of Ang I and bovine serum albumin (Ang I – BSA). 75  $\mu$ L of Ang I-antibodies in assaybuffer above including 0.01% Tween 20 were added and a primary incubation made at 4 °C overnight. The plates were  
30 washed 3 times with PBS including 0.01% Tween 20, and then incubated for 2 h at rt with an antirabbit-peroxidase coupled antibody (WA 934, Amersham). After washing the plates 3 times, the *peroxidase substrate* ABTS (2,2'-azino-di-(3-ethyl-

benzthiazolinsulfonate), was added and the plates incubated for 60 min at room temperature. After stopping the reaction with 0.1 M citric acid pH 4.3 the plate was evaluated in a microplate reader at 405 nm. The percentage of inhibition was calculated of each concentration point and the concentration of renin inhibition  
5 was determined that inhibited the enzyme activity by 50% ( $IC_{50}$ ). The  $IC_{50}$ -values of all compounds tested are below 10  $\mu$ M.
